

Jade Brandt

As new Mexico already struggles with water and power prices I do not think considering a project like this is not good for any of our communities. These data centers have proven again and again across the country to negatively impact the communities they encroach on. Air and water quality goes down and electricity bills go up for the general public. The AI boom has not made the lives of regular people better. It is overwhelmingly failing. Failing in its ability to perform when implemented. Failing in its ability to even make the tech companies money (though, who cares?). It is costing working people their jobs. Why should we put our ecosystems and communities health at risk to build infrastructure for a tech that nobody wants or asked for, underperforms at every level, and hurts working people? New Mexicans do not want data centers!
