

Aris Gutierrez Gonzalez

Im an Earth and Planetary Sciences Major at UNM. I can already say that it's a BAD idea to let a data center be built in New Mexico. We already struggle with water supply for long term use now. What makes them think a data center is what we need. We are trying to conserve water use already for long term storage and to keep a sustainable future for growth. Our Rio Grande is drying up which is the main use of water that we rely on. We literally CANNOT afford a data center in New Mexico. This can drastically drain our resources. This data center will be using up more water than most towns here. New Mexico does not have the resources for a data center and even if we did, we still don't want a data center
