

Anika Tackitt

Project Jupiter would be disastrous for our climate and could drain the fresh water supply. Large AI data centers can use up to 5 million gallons of fresh water a day, and considering that Project Jupiter is proposed to be one of the largest data centers in the world, there is no doubt that it would likely exceed this already astonishingly large number. Furthermore, those living near AI data centers have reported unsanitary drinking water as well as loud, nonstop noise coming from the centers. We do not need AI data centers, we need clean water, a clean climate, and comfortable living conditions.
