the new project called project Jupiter's issues(world wide or in NM) Dona Ana's air quality does not meet the federal government rules and that's why the residents has been impacted disproportionately.i would love to mention weather temperature and global warming. Apparently, jupiter project releases 10 milion tons of carbon dioxide into the air per year!the amount of CO² in the air has been getting higher and higher because of multiple other reasons, and now imagine the disaster that can happen after project jupiter!the amount of CO² in the air has direct effect on air temperature that's why letting go 10 MILION TONS of carbon dioxide in the air must be insane!!there are many elders and outworkers that pass out because of the heat and if they release THIS amount of CO², people are DEFINITELY going to get heart attacks, heart strokes or dehydrated.Although many kids and elderly woman and man suffer from heart attacks, asthma and cancer and MANY normal people are bothered by the awful air quality that causes many HARMFUL diseases for all the ages, project developers are still insisting on continuing this plan. Moving to another point, I'm talking about ozone or smog, it is approved that ozone has been getting thicker and thicker and even totally gone in some parts, which means UV effects our life and daily activities and the ground, where we live! For conclusio i strongly believe that this project should not be allowed or approved and people's health and life matters more than anything! Thanks for paying attention, looking forward your answer and hope this might change your decision!
