

## Daniel Donahue

We are in the middle of an AI race. Keep that in mind! The jobs at this company is promising may be very short-lived if their version of AI doesn't win the race and even if they do, he needs to seriously look at whether the New Mexico infrastructure can handle a data center they use a tremendous amount of electricity and once the construction is over, they create very few jobs if the water that they use is not very closely vetted, and if it's too high, make them go somewhere else. Water is gold in the desert. Don't waste it on an iffy technology.
