

Ronald White

In addition to the massive releases of CO₂ and particulate matter, which should not be allowed in a Federally recognized air quality non-attainment area, please look at the impacts of the heat that will be generated as a result of the cooling required to run the Jupiter Project's computer network. Part of the region's non-attainment issue is that frequent and long-lasting temperature inversions occur in southern Dona Ana County. Adding more heat will increase the frequency and severity of those events.
