

Katherine Colindres

Creating another data center when we are already at the brink of having no clean drinking water will only enhance the situation even more. Many more communities will struggle from dehydration with how big project Júpiter is planning to be. This data center isn't just harmful it is completely unnecessary considering that AI is nothing but a harmful tool made by companies to increase their profit. We lived without it before we can live without now. There should be no reason we are destroying ecosystems over something we don't need.
