

Trinity Dimas

There is no safe way a data center, especially one at this scale could keep its promises of clean air when smaller ones running on the proposed sources cant. No one wants this and will only cause more problems for New Mexico as a whole, not just the rural area. The air quality is already questionable, so why take the risk on this when the company has already (allegedly) been falsifying approvals of said center as seen in multiple news reports. If they are willing to use people's identities to fraudulently make Project Jupiter seem popular amongst New Mexicans, they are likely lying about their promises, and they are on multiple fronts. But this is about air quality. I do not approve and will never approve.
