Project Jupiter's power plant will release up to 10 million tons of climate-warming greenhouse gasses every year. This would make a mockery of NM's climate goals, and erase most of the climate progress we have made in the last two decades. This is more greenhouse gas pollution than New Mexico's three largest cities combined – Albuquerque, Las Cruces, and Santa Fe. The earth is already warming by a considerable amount, already the temperature is bleaching coral reefs which are vital to the earth's ecosystem, in addition to this, it is now not uncommon to have several people die due to heatstroke during the summer, I am aware that the earth's temperature naturally fluctuates, however, it will eventually reach a point where crops fail and livestock die which will cause major food shortages, and that's assuming that the unusually high temperatures don't kill parts of the population. Keeping all of that in mind do you really think that it is appropriate to build yet another power plant, especially one that will cause the quality of life of vulnerable people to massively decrease?
