The use of solid oxide fuel cells is a very good and ecofriendly idea but the way the company plans to implement them is too costly to the environment. The carbon dioxide emissions by themselves are too great a toll and the natural gases that would be used make it worse. The project could result in serious harm to the community around it and the ecosystems due to its massive negative environmental effects.

The permit must be firmly denied and the project shut down unless the company improves its ways and fixes its management.
