

Sofia Enriquez

New Mexico is already experiencing the brunt of global warming in the USA. Approving the air quality permit for the proposed LLC-YGI Microgrid is unacceptable. The addition of the microgrid will produce more green gases, exacerbating global warming. But that's not all. As we've seen with in Texas, the construction of AI datacenters has the potential to drastically increase utility costs for rural communities and decrease the resilience of our water resources. It is up to YOU to protect our people and our resources from companies who only care about Turing a profit. Let New Mexico be an example to other states on how to resist these corporations!
