

Deborah E. Mcneill

Project Jupiter, a concept that we don't need in the world, will only aggravate the existing problems and make the situation even worse. With our limited water resources being wasted on AI development, the temperature is alarmingly rising, threatening to ignite forest fires and dropping the world into freezing temperatures, even causing boiling water to freeze in an instant. If Project Jupiter continues, the consequences will be drastic for the planet and the people on it. As a 19-year-old college student, I aspire to live a life free from fear for my future and the future of others. However, as I witness the world's deteriorating state, I believe I should add to the positive cause instead of the negative and not sit back. Instead of investing in Project Jupiter, I believe we should redirect our efforts towards cleaning up the ozone layer and reversing the damage caused by our past decisions before it becomes irreversible. Many individuals are dedicating their time and energy to combating environmental issues and adopting clean fuel and energy sources to create sustainable solutions, rather than adding to the harm to our planet. It is important that we end Project Jupiter before it is too late for all of us.
