

Carolyn Nair

I strongly oppose the air quality permit and the micro grid system for project Jupiter. This project will produce more greenhouse gases than Albuquerque and Las Cruces combined. The cost of this air pollution/negative externality will be paid by NM residents' health. It will impact human health and increase deaths and diseases from air pollution. It will exacerbate the impacts of climate change on living things in NM that are already experiencing extreme drought and warming winters. Our future will have much less water and this project prioritizes a tech/data center over people and the basic needs of clean air and water. There must be another way, such as constructing their own solar grid.

I also oppose this project due to concerns over its use of NM water resources during a time of extreme drought and the beginning of a climate turning point.
