

## Blair Jefferson

Hello, I lived in New Mexico my entire life. It's a beautiful state full of amazing people and climate. However, it's a desert. It's hot. Project Jupiter will only increase the intense heat's New Mexicans already experience. The heat, as is, already cause health issues for many New Mexicans. Furthermore, AI data centers will contribute significantly to the Earth's greenhouse gases, and further warm up not only New Mexico, but the globe. Additionally, AI data centers existing in other states and counties already pose challenges for their civilians. Many of those civilians experience an increase of direct pollution and lack of clean water (or water entirely). The figureheads of data center projects even have the gall to ask citizens to limit their water intake so that it may be used for their establishments. It's unethical and immoral to impose critical danger on New Mexicans without their best interest in mind. It's a shame that the innovation of AI is deemed more important than the wellbeing of New Mexicans. Fully understand these risks, and I sincerely hope this project does not come to exist. I truly believe New Mexico, its climate, and its citizens are worth far more than a data center. New Mexico is our home, there isn't another.
