

## Jason L Biesecker

3. 20.4.1.900 NMAC (incorporating 40 CFR §270.42(b)(1)(iii)) requires the applicant to explain why the modification is needed.

The DOE will perform an audit at least once every 2 years at each small quantity generator/storage site shipping transuranic (TRU) mixed waste to the WIPP facility. This change applies to the following small quantity generator/storage sites; Argonne National Laboratory (ANL), Sandia National Laboratory (SNL), and Lawrence Livermore National Laboratory (LLNL). This schedule is appropriate for the following reasons:

Suggest adding Idaho National Laboratories (INL) Centralized Characterization Program (CCP) to the listing for small quantity generator/storage site, within the two (2) year audit cycle.

INL/CCP provides only a limited number of shipments per year, that would facilitate the categorization of a small quantity generator/storage site. INL/CCP should not be confused or considered a part of the Advanced Mixed Waste Treatment Plant (AMWTP).
