

## Jean Stevens

Please remove all legacy waste from the Los Alamos National Laboratory ASAP to WIPP! There is currently a film which premiered at the Telluride Mountain Film Festival in May, "Burn Scar" about the 250,000 acres that burned near Mora in 2022. What would happen, during the worst recorded drought in NM, if the same thing happened at LANL.

I live in Taos, 45 miles downwind from LANL. Many people evacuated in 2011 when the Los Conchas fire came within three miles of Area G. This was broadcast nationally that about 60,000 barrels were sitting under tents. LANL has been extremely irresponsible to the all the human souls residing in Northern NM! Many folks, whom could, evacuated Taos in 2011. Plutonium cannot be detected by Geiger Counters which were placed at Holy Cross Hospital

The residents of Northern New Mexico dodged a "radioactive bullet" in 2012 but our luck cannot last with the historic droughts we are living with in 2026 and beyond!
