

## Paul Davis

In maps presented during the 2/12/25 public meeting, your focus seems to be on areas of known water storage (evaporation ponds, etc.). However, there are countless very old water pipes associated with the power plant. Will you be searching for leaks from these pipes? And, how can you look for these leaks under the powerplant before the plant is completely dismantled and removed? Have you spoken to any of the workers who are/have been dismantling the powerplant to discuss the condition of the pipes they have removed?
