

Sandra Moore

I watched the Produced water comment meeting this morning. I am disappointed that the project plans to go forward when research on the water content remains scant. PFAS, arsenic, and other toxins are present. I am unaware of plans regarding how to remove them. Additionally, there is no accountability regarding who is responsible when problems arise. What if problematic produced water manages to leach into the aquifers? That aquifer is destroyed. If the water flows into streams and rivers the people and water are sickened. 150 ft is no safe distance. Bench this project until the above concerns have been addressed.
