

Rebecca Drummond

My home flooded in 2017 and I believe the proposed best management practices do very little to help control sediment pollution from mines in the Lake Houston area. The proposed practices do not address the discharge of sediment laden

Water that leads to sediment pollution. The BMP's also does not address Pit capture which is an ongoing problem in Lake Houston. The blockage of the diversion ditch in the Kingwood area from sediment is a serious problem that contributes to dangerous flooding. Please address the real problems that are causing flooding in the Lake Houston area.
