

William Sellers

It facilitates the recycling of Aluminum, so do it.

#2. Lithium in batteries will soon be replaced by aluminum, TESLA has already made plans to do this 100% by end of 2026. Many others also doing such. That reduces the mining potential of lithium; not only are the aluminum-ion batteries less expensive, longer lasting, recharge quicker, less thermally reactive & dangerous, they can be recycled easier.

#3. A no-brainer for So. Arizona...do it.
