

Bob Wright

We live in Saint David and I see the particulates from Apache Powder every morning along the river. Benson is in a valley and the emissions from the Aluminum Dynamics plant will be doing the same thing. What is it going to be doing to the soil in one month, one year, and ten years? What is the plan for damage control? The amount of water they will be using in a month will suck the valley dry. What is the plan there? The other concern is the health of the citizens of this valley. We dont need another plant coming here and emitting any more particulates into our air and our lungs. We need to have a monitoring system for every day. We see Apache Powders emissions every day. It is not a pretty sight.
