Email message:

I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location. Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Pam Sheppard and I am a grower from Biggs in Butte County and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

Read last paragraph

My name is Maria Espino and I am a grower from Gridley, Butte county, CA., and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

Stop making city decisions for rural areas. With the complete disconnect from food to table by citizens it is stressing out the farm community because it needs to be farmers making decisions not based on fear. We have been farming for generations. No one is more concerned about land and use of chemicals more than us!

Maria Espino

If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Christine and I am a grower from Sanger, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Dayna and I am a grower from Petaluma, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Montalvo Family Farm LLC and I am a grower from Cambria, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

You don't often get email from jsjohalsonsync.johal.699511646@yourconstituent.com. [Learn why this is important](#)

EXTERNAL:

My name is JS Johal & Sons Inc and I am a grower from Yuba City, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is

Virgil L Thompson and I am a grower from Oakdale, CA Stanislaus County and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Keri and I am a grower from Visalia, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

You don't often get email from michael.milovina.699033830@advocatefor.me. [Learn why this is important](#)

EXTERNAL:

My name is Michael and I am a grower from Hopland, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

You don't often get email from david.baker.699295198@yourconstituent.com. [Learn why this is important](#)

EXTERNAL:

My name is David and I am a grower from Modesto, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

You don't often get email from james.spinetta.699167295@sendgrassroots.com. [Learn why this is important](#)

EXTERNAL:

My name is James and I am a grower from El Dorado Hills, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Glen and I am a grower from Porterville, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

You don't often get email from sarbjit.johl.699626575@p2a.co. [Learn why this is important](#)

EXTERNAL:

My name is Sarbjit and I am a grower from Marysville, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Cherokee and I am a grower from Yuba City, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Melissa and I am a grower from Bakersfield, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. My name is Charles and I am a grower from Denair, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

Subject: Carl Soares - DPR 23-003 Statewide Notification of Agricultural Use of Restricted Materials

You don't often get email from carl.soares.699027514@sendgrassroots.com. [Learn why this is important](#)

EXTERNAL:

My name is Carl and I am a grower from Tulare, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

You don't often get email from michael.yu.699035730@p2a.co. [Learn why this is important](#)

EXTERNAL:

My name is Michael and I am a grower from Irvine, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Tome and I am a grower from Ballico, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Roger and I am a grower from Temecula, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

Subject: Chris Ward - DPR 23-003 Statewide Notification of Agricultural Use of Restricted Materials

You don't often get email from chris.ward.699030198@advocacymessages.com. [Learn why this is important](#)

EXTERNAL:

My name is Chris and I am a grower from Visalia, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.

EXTERNAL:

My name is Scott and I am a grower from Alturas, CA county and I have critical concerns about the proposed NOI public system.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

I believe in investing in safer pesticide products, and practices to safeguard growers, employees, and the public. But I also believe that California currently has the most transparent pesticide regulatory system in the world. Currently, the public can inquire at any California Agricultural Commissioner's office throughout California when a restricted use material will be applied in that respective county on any given day. The State and therefore the Department should feel confident in this system too.

I agree that it is very reasonable for notification to include active ingredients, permit and county number, application date range, and relevant label information but should not include, method of application, acres applied, or exact location.

Farmers and applicators who would be subject to notification are reasonably concerned that applicator-specific information could be found by activists to motivate protest events, on-farm trespass, and could encourage significant appeals of NOIs, leading to possible crop loss, and pest outbreaks. If DPR cannot scientifically validate what health protective behavior should result following notification, and if there is no difference in health impacts between an immediate neighbor and one mile away, then the risk of identifying site of application is too great.

Therefore, we encourage the regulations not specify acreage covered as we do believe that though there is no inclusion of address, in rural areas specifically, applicator specific information can be found. We also encourage the Department to consider the complications that may arise for the Agricultural Commissioner's Office, who will be responsible for dealing with concerns from all stakeholder groups.
