

Day Johnston

I am just becoming aware of this notification. Being made aware of spray days sounds good in theory but what can someone do that lives near an area? I'm stating my opinion concerning the over use , more potent toxic chemicals being used than are probably necessary . Obviously it's not my field of expertise but I know in my own garden, less is more effective. Can you get serious about reducing and looking into less dangerous and healthier alternatives? Also how does knowing that you're spraying near schools or residential areas help?
