

## Alec Dixon

PAN-1; Additionally, such important pesticide application disclosures are critical for the legal licensed and regulated CA cannabis supply chain, now one of the primary tax revenue generating industries in CA. Cannabis is now tested to a level beyond water and food testing standards (rightfully so and food should follow) and often residual drift from pesticide applications from agricultural farmers not following FIFRA, lead to tens to hundreds of thousands of dollars of crop damages that cannabis farmers incur, near and adjacent to agricultural areas, due to lax and hap-hazardous pesticide applications that are unfortunately more common than not within agriculture where farmers aren't actually following FIFRA guidance. Thank you for prioritizing the health of Californians and our environment over the broken and unaccountable system of indiscriminate pesticide and agrochemical applications that are decimating the health of our citizens (all life forms, really) and our once pristine environment.
