I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ali Van Zee
Fort Bragg, CA 95437

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ryan Dell
Santa Rosa, CA 95405

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Robert Blackey
Claremont, CA 91711

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Marianne Doar

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Debra Rogers
Nicasio, CA 94946

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Lauren Bouyea
Sausalito, CA 94965

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jordan Briskin
Palo Alto, CA 94306

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Donna Eveland

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ked Garden
Lemon Grove, CA 91945

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Allison Blair
Mount Shasta, CA 96067

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jonathan Eden
Berkeley, CA 94707

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

lauren coodley
Napa, CA 94558

The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Laura Hilgers
Laguna Woods, CA 92637

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kelly McDowell
San Diego, CA 92104

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Mary Doane
Watsonville, CA 95076

Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Bill Wood
Mount Shasta, CA 96067

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Karin Rettig

For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Juliet Pearson
Grass Valley, CA 95949

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Catherine Beauchamp
Pasadena, CA 91103

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Christie Decker
San Francisco, CA 94109

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Christopher Geukens
North Hills, CA 91343

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Richard Gallo

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Marilyn Hall
Abingdon, MD 21009

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Mary Hoffman
Santa Barbara, CA 93105

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Anthea Josling
Davis, CA 95616

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

MaryAnn Bomarito

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Carolyn Tormey
Yorba Linda, CA 92886

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Cynthia McHugh
La Mesa, CA 91941

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Cheri Iadevaia
Ventura, CA 93003

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ellen Little

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Pamela Saulter
Perris, CA 92571

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Lucy Hart
Encino, CA 91316

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

tony lorito
Los Angeles, CA 90036

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Erin Whitford

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Patricia Cohen
North Hollywood, CA 91602

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Peter Haws
Davis, CA 95616

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Esther Voisin
Topanga, CA 90290

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Tem Narvios

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Michelle Zuest
Bonsall, CA 92003

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Leah Fagundes
San Pablo, CA 94806

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Anna Kolovou
Woodside, NY 11377

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

linda sommer

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Amelia Birchfield
Santa Barbara, CA 93111

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ron Hansel
West Covina, CA 91790

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Charles and Karen Julien
Fullerton, CA 92835

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Elizabeth McNeil

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Nancy Attanasio
Pasadena, CA 91106

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Terra Shapiro
San Marcos, CA 92069

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Francesco Masiello
Long Beach, CA 90804

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Christine SIRIAS

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Robert Giles
Escondido, CA 92029

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Elizabeth Neubrand
San Diego, CA 92116

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

M Dean Griswold Jr

And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Craig Markson
Santa Barbara, CA 93101

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Patricia Bryan

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Justin G

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

John Costello
Bodega, CA 94922

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Corey Barnes
Sebastopol, CA 95472

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Korinne Taylor

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Randy Gerlach
Daly City, CA 94014

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Alisha Seaton
Los Angeles, CA 90034

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Diane Barbera
Sonoma, CA 95476

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Christina Walsh-Curley

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ron Smith
Rancho Mirage, CA 92270

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

David Wendt
Walnut Creek, CA 94596

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Peggy Deluce
Sacramento, CA 95829

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Beth Herndobler
