I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Bridgett Heinly
San Diego, CA 92107

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kristen Stanton
Sausalito, CA 94965

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Bruce Hartzell
Los Angeles, CA 90066

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Charlotte Masarik

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Rachel Beck
San Francisco, CA 94121

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Janet Soderstrom
San Ramon, CA 94583

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Lynette K Henderson
Chatsworth, CA 91311

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Anita Wisch

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Judith Smith
Oakland, CA 94601

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Angelo Simao
Chico, CA 95928

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Thomas Conroy
Manhattan Beach, CA 90266

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Paul Ramos

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Margo Sher-Bainbridge
Mckinleyville, CA 95519

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Francesca Suzio
El Sobrante, CA 94803

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Gary Dowling
Novato, CA 94947

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Katie Zukoski
Chico, CA 95928

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

amber sumrall

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ronald Jacob
San Jose, CA 95117

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Krissy Strle
Littlerock, CA 93543

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Chris Evans

The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

John Teevan
Chula Vista, CA 91914

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Beatriz Pallanes
Santa Ana, CA 92704

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jacqueline Waddill
Pasadena, CA 91107

Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Connie Lindgren
Arcata, CA 95521

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Martin Tripp
Santa Clarita, CA 91390

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Daphne Lake

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Donna Cottrell
Long Beach, CA 90808

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Monica Padilla
La Mesa, CA 91942

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Bradley Jones
Sebastopol, CA 95472

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Rachel Grigelis

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Bonnie Burke
San Diego, CA 92160

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Bruce Wismer
Richmond, CA 94801

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jimmie Lunsford
San Diego, CA 92116

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Mariam Shah-raïs

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Elizabeth Johnson
Albany, CA 94706

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Julie Alicea
Denair, CA 95316

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Alex Garcia
Alhambra, CA 91801

And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Laurie Claudon
Saint Helena, CA 94574

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Rebeca Byerley
Upland, CA 91786

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Emily Jones

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Janice E. Beyer
Stockton, CA 95203

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Cindy MacDonald
Suisun City, CA 94585

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Annemarie Girard

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Margaret Seltzer
Studio City, CA 91604

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Lydia Tinder
Stockton, CA 95219

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Robert Lentz
Sylmar, CA 91342

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Nancy Sidebotham

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jennifer Bair
Sacramento, CA 95818

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Joseph Woodard
Alameda, CA 94501

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Dianna Ruggiero
Los Angeles, CA 90036

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ann Glucroft
Oakland, CA 94618

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Teresa Canode
San Luis Obispo, CA 93401

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Cheryl Lewis
San Luis Obispo, CA 93401

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jim Carpenter
Sutter Creek, CA 95685

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Carly Ritter

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

glenn majeski
Daly City, CA 94015

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Robin Weirich
Irvine, CA 92618

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Wayne Steffes
Redding, CA 96001

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Mary Love

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kay Cerny
Long Beach, CA 90808

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Gary and Seraphina Landgrebe
Soquel, CA 95073

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Margaret Lewis
Eureka, CA 95503

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Rhonda Carvalho

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Aaron Kenna
La Mesa, CA 91942

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Marilyn Barthelow
Auburn, CA 95602

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Heidi Behnke
Spring Valley, CA 91977

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Janet Parks
