

## Suchi Jain

It is imperative that we continue to impose restrictions on the use of chemical agents intended to eliminate species that humans deem pests, and instead promote the adoption of environmentally sustainable alternatives. Achieving this objective requires robust governmental support and the implementation of effective regulatory measures. With bird populations already declining at an alarming rate as a result of global warming, it becomes our foremost responsibility to reduce the use of such harmful substances in order to provide some relief to the wildlife that depends on our stewardship. Furthermore, the use of anticoagulant rodenticides should be strictly prohibited, given their severe and far-reaching impact on ecosystems and non-target species.
