I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Karen Dorfman
Goleta, CA 93117

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Andrea Horbinski
Berkeley, CA 94708

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Carol Sangster
Ojai, CA 93024

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kevin Bissonnette

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kathleen Salvas
Grass Valley, CA 95945

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Mortimer Karla
San Francisco, CA 94110

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kevin Riley
Riverside, CA 92506

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Mary Quimby

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Edward Macan
Eureka, CA 95501

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Lucia Hall
San Diego, CA 92117

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Barbara Judson
Santa Rosa, CA 95403

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Mark Glasser

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ann Baker
Placerville, CA 95667

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Joan Wickham
Pasadena, CA 91107

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kermit Cuff
Mountain View, CA 94041

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Robert Burger

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Signe Swenson
Walnut Creek, CA 94596

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jacqueline Baudouin
Lafayette, CA 94549

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ralph Bocchetti
Fontana, CA 92337

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Stephanie Larro

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Thomas Filip

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

LAUREN SCHIFFMAN
El Cerrito, CA 94530

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Tom Behlmer
Grass Valley, CA 95945

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Nicole Mikals

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Joan Wager
Berkeley, CA 94708

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Lisa Piner
Costa Mesa, CA 92626

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Janet Benevento
San Jose, CA 95118

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Tom Nulty Jr

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Judith Metzener
Alameda, CA 94501

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Shawn Johnson
Encinitas, CA 92024

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

manuel santos
Sacramento, CA 95831

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Laurise Michel

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Linda Savage
San Leandro, CA 94578

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Maggie Hughes
Berkeley, CA 94704

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

carol easton
Aptos, CA 95003

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Victoria Shepherd
Glendale, CA 91201

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

HC Cannon
Forestville, CA 95436

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

DIANE MOORE
Davis, CA 95616

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

TB Sojka

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Sean Hagstrom
Redlands, CA 92373

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Elizabeth DeVincenzi
San Jose, CA 95135

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Donald McGrawMSPHD
Chico, CA 95928

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Melinda Encinas

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Gabrielle Zera
Laguna Niguel, CA 92677

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

C Swenning
Richmond, CA 94805

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Brion Charles
San Francisco, CA 94115

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kathryn Murphy
Aptos, CA 95003

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Brandi Farrar
Ben Lomond, CA 95005

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Alice Neuhauser
Manhattan Beach, CA 90266

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Carmen Klucsor
Vallejo, CA 94591

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

chris sasaki

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jennifer Ghilotti
