Please see attached 3,443 comments from Center for Biological Diversity supporters urging you to outright ban the use of anticoagulant rodenticides in California.

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Trish Tuley
Mountain Center, CA 92561

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and pets and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Sheila Desmond
Shingle Springs, CA 95682

Sincerely,

Kyri Freeman
Barstow, CA 92312

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

The law of unintended consequences concerns me as a wildlife biologist who worked for the US Forest Service for 30 years. When it comes to poisons they have a way of killing a lot more species than we target so in my opinion they should be banned. It's too easy to poison our way out of life with varmints. Consider target specific trapping methods although I realize that it means more work; but if the science shows poison kills non target animals then that extra work is worth it. I agree with the Center for Biodiversity who wrote the letter below! I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

My neighbors and I spend endless hours advocating for people to stop using anti coagulant rodenticides, we have owls, and other raptors being killed. Now I hear that its your actual job is to make our wildlife and pets and children safe! What are you waiting for? Please ban these chemicals asap. I cant believe you are considfeing expanding their use to restaurants and shops. This is CA, not some Red state run by industry. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course NOW and ban the use of anticoagulant rodenticides in California.

Sincerely,

Linda Kade
Vallejo, CA 94590

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

As a California resident, I'm writing in support of a full ban on anticoagulant rodenticides. These poisons are infamous for killing non-target animals like mountain lions, owls and fishers. They cause a truly brutal death, complete with internal bleeding and organ failure. And they pose a health threat to humans. Plenty of less toxic alternatives to anticoagulant rodenticides exist. Let's treat them like DDT, another highly toxic pesticide now fully banned, rather than allowing loopholes. As far as I'm concerned, there's no logical reason to use anticoagulant rodenticides even around heavily trafficked areas like restaurants and grocery stores. (In fact, they would seem to pose a particular threat to kids and pets in those locations.) Thanks for taking the time to review my comments.

Sincerely,

Jesse Greenspan
Berkeley, CA 94703

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Before I even talk about anticoagulants I want to say that there are now birth control options for rodents and the use of any poisons is becoming outdated! Mountain lions, bobcats, owls, coyotes etc... eat MANY poisoned rodents. They figure out that it's easy pickings because the animals are dying. In Altadena before the fire we had at least 2 lions that died from rat poison. However, given that, I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply RELIEVED that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also SAVES wildlife and SUPPORTS important legal protections. For these reasons and more, I urge the department to STAY THE course and DO NOT ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobCATS WHICH CAN NOT BE HUNTED. Viable, cost-effective alternatives to anticoagulant rodenticides DO NOT exist and WILL NOT successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first ARR JUST FANCIFUL PIPE DREAMS THAT ARE ONLY MINIMALLY EFFECTIVE. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations BUT ARE ALSO NOT THAT EFFECTIVE BUT THEY ARE COST PROHIBITIVE. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and DO NOT put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives DO NOT already exist — I urge the department to NOT ban the use of anticoagulant rodenticides in California.

Sincerely,

Daniel Epperson
Ione, CA 95640

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. What the hey? Torturing wildlife to death? Why aren't you protecting them?? For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jenifer Steele
Berkeley, CA 94703

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I live on a hillside where I regularly see coyotes that are obviously suffering from exposure to rat poison. I've had the misfortune of witnessing two bobcats die, victims of rodenticide poisoning. It was painful to see and deepened my understanding of the toll these poisons take on our wildlife. It troubled me to learn that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. This is a terrible idea! The department's proposal to allow use of these rodenticides for more than 100 days per year poses a significant threat to wildlife and undermines important legal protections. It also threatens pets that may come into contact with dying rats and ingest these hideous poisons, causing them to die an agonizing death. There are better, more humane ways to control rat populations. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am amazed and disturbed by the box we have created and trapped ourselves in. We think poison is our way out of all that we consider to be a nuisance, pest, or inconvenience. We rarely look inward to ask if we have any of these unfavorable traits. We do, but we get a free pass while other creatures, who have just as much of a right to survive, are subjected to immense cruelty. We hold accountability for this problem and the solution is not poison. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Paul David Tuff
Salinas, CA 93901

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am writing to urge you to impose much more stringent controls or outright bans on the use of anticoagulant rodenticides which are causing serious harm to all animals, including non-target native wildlife. It is extremely concerning that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores. These highly toxic poisons are rightly currently prohibited in these areas. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. Therefore, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Sam Butler
Los Angeles, CA 90045

California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than one hundred days annually, threatens wildlife, and undermines important legal protections. For these reasons, and more, I urge the department to change course, and to ban outright, the use of anticoagulant rodenticides in California! Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife -including mountain lions and bobcats, spotted owls and San Joaquin kit foxes. This is sad waste of life as viable and cost-effective alternatives to anticoagulant rodenticides already exist, and would successfully address the threats posed by rodent infestations. Working to prevent infestations by further implementing integrated pest-management strategies like sealing buildings, and eliminating the food and water sources that draw rodents in is a crucial first step. Then control strategies, like contraceptives, snap traps, electric traps, and other types of nontoxic methods could be used to address ongoing infestations. For worst-case scenarios, more than one hundred less toxic, non-anticoagulant rodenticides wstill be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations cannot be addressed in any other way, the department could allow very limited emergency exemptions for anticoagulant rodenticides. The science is overwhelming: Anticoagulant rodenticides hurt wildlife, and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause, and because safer and cost-effective alternatives already exist, I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Vanessa Santarsiero

The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California. STOP THIS YOU STUPID FOOLS!

Sincerely,

Janet Heinle
Santa Monica, CA 90403

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am dismayed and very puzzled that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and BAN outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Sarah Hearon
Santa Barbara, CA 93130

The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Karen Jacques
Sacramento, CA 95811

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I implore you to NOT move forward with the California Department of Pesticide Regulation's recent draft regulations that will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. In fact, anticoagulant rodenticides should be banned entirely in California. Even with current restrictions on rodenticides, there are so many unnecessary poisonings of non-target animals each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. We have 'lost' so much wildlife in the past 5-7 decades that there is simply no justification for continuing to use poisons like these that result in so much more wildlife loss. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Judy Schultz

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

We used to have two hawks that stood watch and hunted in our San Francisco neighborhood. Now there is only one. I fear its mate may have ingested a rodent contaminated with anticoagulant rat poison. These rat poisons kill anything that comes in contact with them including pets and children as well as the hawks who manage rodent populations naturally. I am very disturbed that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. Sherrill Futrell
Davis, CA 95618

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am aghast that the DPR recent draft regulations would expand the use of anticoagulant rodenticides near restaurants and grocery stores, in places where they are currently banned. Such action would threaten wildlife and undermine important legal protections, while benefitting only the pesticide industry. Our local grocery store, the Davis Food Co-Op, has for years had no problem controlling rodent pests with professionally overseen traps that kill only rats -- with no secondary harm. There's no reason why these traps cannot be employed elsewhere they are deemed necessary, along with low-cost cultural adaptations such as keeping trash containers locked, trash and fallen fruit picked up and ground cover plants eliminated. Indeed, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California, which even with current restrictions inflict terrible and unnecessary harm to wildlife and pets.

Sincerely,

Janet Krovoza
Davis, CA 95616

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm FURIOUS that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. THIS IS JUST MASSIVELY DISGUSTINGLY TERRIBLE SHIT. YOU MUST STOP USING THIS STUFF!! IT'S PURE TORTURE AND CAUSES A HORRENDOUS DEATH FOR WHOEVER INGESTS IT. For these reasons and more, I urge the department to ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. DO NO HARM!!!!!!~

Sincerely,

Karen Evans
Woodacre, CA 94973

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

California has always been a leader in pro-environmental regulations. Which is why it concerns me very much that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections because, as I am sure you are aware, if a rat is eaten by another animal or bird, that creature will die a horrible death too. For these reasons and more, I urge the department to change course and ban the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in is a crucial first step. Then control strategies — such as contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Terry Skinner
Buena Park, CA 90620

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California. Animals across the spectrum are being killed by rodenticides. Let's ban these toxins NOW!

Sincerely,

Karin Yehling
Sylmar, CA 91342

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I have personally been affected by anticoagulants. My little dog died a terrible, agonizing death due to rodenticide anticoagulants. It cost thousands in vet bills to try to save him but sadly it was too late. Humans need to be more creative in controlling pests. We need to lessen our dependence on toxic pesticides. They are poisoning our land and our animals, including humans. I am deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply alarmed that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The Department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the Department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing our state's irreplaceable wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, in urban areas, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the Department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Lori Jirak
Julian, CA 92036

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will now allow for an unwarranted expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. It is 100 days per year that will result in thousands of deaths of other wildlife, household pets and the possibility of harming our children. Such an expansion is ill-advised, unwarranted and will result in far more significant damage and loss than it will try to resolve. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I strongly urge the department to outright ban the use of anticoagulant rodenticides in California.

Dear Director Morrison,

There is NO WAY to keep anyone, human or animal safe with this change! Where is your common sense? I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Christina Frank
Ojai, CA 93023

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

DO NOT permit the further poisoning of our land, animals, and people!!! I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Sheryl Rose
Berkeley, CA 94702

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. My cat sneaks out of the house from time to time. The first time, he returned with a dead rat. My heart was in my throat for 24 hours, watching for signs of poisoning. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Norma Wallace

California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. We are in the midst of accelerating biodiversity loss. A sixth mass extinction event that is, for the first time in all of existence, the result of the impacts of a single species. Homo sapiens. Actions such as deciding to expand the use of poison, is contributing to this loss. We know that rodenticides kill beyond the target species. The fact that they do also speaks to how unnecessary rodenticide is, as native predators perform the same job without poisoning the world around them. Instead of lowering the carrying capacity of the land that supports healthy raptor populations and others, we need to strengthen protections against rodenticides, and close loopholes that allow industry to poison ecosystems regardless. Spreading indiscriminate toxins is not an acceptable business practice. I've reported on unlabeled rodenticide boxes that were placed in the territory of a pair of red-tailed hawks on a number of occasions. I've observed them eating rodents upon a metal arch way that arched over such boxes. Just absolutely appalling, oblivious, out-of-touch with the life all around us. A female golden eagle named Lucina, whom I observed raising eaglets since 2021, died last year from rodenticide. She was found dead bleeding out from her mouth and nostrils as her blood could no longer coagulate. Lab work later revealed this depressing reality. Please keep out of sight wildlife firmly in mind. POISON IS NOT OKAY. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Erin Barca

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I live in the Sierra Nevada foothill, where I share the environment both with rodents (some of which I'm not crazy about!) and raptors and owls. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. The wider availability of surveillance cameras, especially in developed areas, has documented the surprising adaptability of many predator species such as foxes, coyotes, and predatory birds, and they are heavily impacted by rodenticides in the prey they eat. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jeannine Koshear
Coarsegold, CA 93614

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Cost-effective alternatives to anticoagulant rodenticides already exist such as implementing integrated pest-management strategies, sealing buildings, and eliminating the food and water sources that draw rodents in, and control strategies — like contraceptives, snap traps, and electric traps. More than 100 less toxic, non-anticoagulant rodenticides would still be available. In serious public health or environmental emergencies, the department could allow VERY LIMITED emergency exemptions for anticoagulant rodenticide use.

Sincerely,

Paula Silver
Oakland, CA 94602

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

As a biologist and animal lover, I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Cyn King
Morgan Hill, CA 95037

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Regarding the California Department of Pesticide Regulation's recent draft regulations that will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores: The department's proposal to allow use of these rodenticides for more than 100 days per year threatens wildlife and undermines important legal protections. I urge the department to change course and completely ban the use of anticoagulant rodenticides in California due to the harm and painful deaths they cause when predatory wildlife consume rats that have been killed by them. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Patricia Silver
Los Gatos, CA 95033

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. How many times must we petition to have these dangerous products banned in California, once and for all? Even with current restrictions on anticoagulant rodenticides, many poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. And it's not just wildlife: beloved pets in my own neighborhood have experienced terrible deaths by exposure to these barbaric and indiscriminate poisons. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Preventing infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then, common sense control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — can be used to address ongoing infestations. For even the worst-case scenarios, there are more than 100 less toxic, non-anticoagulant alternatives available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in ANY other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is undeniable: Anticoagulant rodenticides harm wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department ONCE AGAIN to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Melissa Mendes Campos
Ben Lomond, CA 95005

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am very concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores—where, currently, they are prohibited. Also, the department's proposal to allow use of these rodenticides for more than 100 days per year threatens wildlife and undermines important legal protections. For these reasons and more, I strongly urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife, including mountain lions, bobcats, spotted owls and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides ALREADY EXIST and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies, like contraceptives, snap traps, electric traps, and other types of nontoxic methods, could be used to address ongoing infestations. For worst-case scenarios, more than 100 LESS TOXIC, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow very limited emergency exemptions for anticoagulant rodenticide use. The science is overwhelming! Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause—and because safer, cost-effective alternatives already exist—I urge the department to outright ban the use of anticoagulant rodenticides in California. Thank you for your time and consideration!

Sincerely,

Mary Rose
Berkeley, CA 94702

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm very unhappy that the California Department of Pesticide Regulation's recent draft regulations would allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and completely ban the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already EXIST and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use under department detailed regulations. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kathy Sabatini

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Anticoagulant rodent baits linger in our food chain for years and travel from mice and rats up to bobcats, coyotes and mountain lions. Almost all my. Lions tested in CA show exposure to rat poison anticoagulants. Is this the intent of residents setting out bait to kill their mouse and rat problems? I don't think so. Go back to snap traps or live traps and take out the real targets, not our apex predators we spend so much funding trying to protect. Bobcats and mt. lions are protected in CA from hunting and trapping, yet we turn around and kill them with rodenticides! It's foolhardy and dangerous. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. I urge the department to ban the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing California wildlife including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Volunteering at a wildlife hospital, I have personally witnessed the suffering and death of non target animals. I also remember a child bringing some bait into my kids' school to show others, not knowing what she was sharing. It could have been tragic if not discovered and taken away from her. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause and because safer, cost-effective alternatives already exist I urge the department to ban the use of anticoagulant rodenticides in California.

Sincerely,

Sheri Kuticka
Concord, CA 94518

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Because I live in the backcountry above San Diego surrounded by forest and nature preserves, we have a large wildlife population and, of course, rats and mice. We must daily concern ourselves with how to live peaceably and be conservators of our environment. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Claudia Previn Stasny
Julian, CA 92036

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Please Do Not allow expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores. The department's proposal to allow use of these rodenticides for more than 100 days per year threatens wildlife and undermines important legal protections. It's sad to read about wildlife dying because of unnecessary toxic chemicals we use. Also, I don't like the idea of going to a restaurant having these toxic chemicals in the restaurant or next to it. I urge the department to ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in are easy steps. Control strategies like contraceptives, snap traps, electric traps, and other types of Nontoxic methods could be used to address infestations. The science is overwhelming. Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause and because safer, cost-effective alternatives exist, I urge the department to ban the use of anticoagulant rodenticides in California.

Sincerely,

Ka Higgin
Tustin, CA 92780

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am so tired of constantly seeing posts of poisoned owls, hawks, mountain lions, coyotes, badgers, and other wildlife, as well as pets that have ingested poisoned rodents. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

In our little mountain town we have lots of forest critters and sometimes they chew up car wires. Usually the bobcats, owls and coyotes keep them at bay. But when neighbors are being stupid and use poison to kill the rodents instead of traps the whole chain breaks down and the problem gets exponentially worse. It's very observable in our little town and becomes an immediate issue! Please ban anticoagulant rodenticides or any rat poison at all!! Please. Physical traps are so much better anyways. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections - especially in areas where I live - right next to the Santa Monica mountains. It's well documented by biologists that our local wildlife including mountain lions, bobcats, owls, hawks and coyotes all suffer immensely from ingesting rats that have eaten the poison. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestation. A lot of restaurants and grocery stores are just plain lazy about keeping the lids of their garbage dumpsters closed in order to keep rats out; and not cleaning around their garbage areas. They could also cheaply prevent infestations by sealing buildings and using contraceptives, snap traps, electric traps, and other nontoxic methods. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jimmy Tallal
Malibu, CA 90265

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I live in a residential area bounded by two great rivers. My yard is populated by all sorts of wildlife, raptors and domesticated felines. I have witnessed painful deaths of many species due to the use of rodenticides by unschooled residents. I'm writing because I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. I want to share with you my grandfather's solution to rodents. He would mix half portions of flour and plaster of Paris on a paper plate. Place the plate above the ground weighed down by a rock. The rodents would eat the mixture and after the first drink of water, the plaster would start to firm up ultimately killing the rodent. If a raptor or other predator caught the rodent, they could eat their prey without being harmed because they avoid what is virtually a chunk of chalk. No self respecting predator eats chalk, nor anyone else. This is a homespun effective remedy for rodents and there are many more that have no lethal effects on wildlife as you know. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

We have been aware of this issue for years and I am interested that so many people don't consider the long-term effects of rodenticides. Once again, we are more interested in short term solutions, unfortunately. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Wendy McCobb
Exeter, CA 93221

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

This is a horrific death for all wildlife. And its ability to travel from small rodents to larger species, killing them all over time is all wrong! I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Patrice Ryan

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

The California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year threatens wildlife and undermines important legal protections. I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* and explicitly defined emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California. As a person of faith, I pray you will use your authority to protect and steward Creation by banning anticoagulant rodenticides. There is no need to start cascading series of harms to control specific infestations. Take science and ethics to heart and become a leader in integrated, thoughtful approaches to preventing and solving problems. Thank you for your time and for acting quickly to keep harmful products out of California's ecosystems.

Sincerely,

Diane Brenum
Oakland, CA 94602

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

California Department of Pesticide Regulation's recent draft regulations should absolutely NOT allow for expanded use of anticoagulant rodenticides. The department's proposal to allow use of these rodenticides for more than 100 days per year is dangerous to humans, threatens wildlife, and undermines important legal protections. Follow sound environmental science, change course, and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist. Ban the use of anticoagulant rodenticides in California.

Fair Oaks, CA 95628

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores (!) — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife, which I know we can agree is highly problematic. Additionally, it undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. However, the good news is that viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, humane traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California. Thank you—your consideration and action on this issue is greatly appreciated.

Sincerely,

M. B.
Costa Mesa, CA 92626

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. These careless products must be banned from sale. Hardware stores and garden stores must discontinue their trade. One hundred days per year means nothing. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The SCIENCE IS OVERWHELMING: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Emily Sparks
Oakland, CA 94611

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am so very concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. Please do not allow these rodenticides to be used anywhere. Please do not threaten wildlife with their use. Please do not undermine important legal protections. Please do the right thing and ban outright the use of anticoagulant rodenticides in California. I understand that viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that attract rodents, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. I also understand that more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. Thank you for taking the time to read my email and to consider my request to ban anticoagulant rodenticides in California.

Sincerely,

Linda Sikes
Dixon, CA 95620

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Keep this poison away from the environment and me.

Sincerely,

chris messick
Ramona, CA 92065

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I work in a school garden. I teach K-5th graders about food chains and connections between us and the world around us. Part of that is how what we do and our actions can affect plants and animals. Because of what I teach and being an advocate for wild places and animals in general, I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jane Forbes
Santa Cruz, CA 95060

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The case against the use of these rodenticides is overwhelming. These are indiscriminate killers because they travel up the food chain. A poisoned rat is a danger to any of its predators, including family pets. We don't want to be poisoning rat predators. There are numerous other methods to manage rat overpopulations that don't endanger any other species, and don't cause horrific suffering for these living creatures either. I urge you to make the science based decision and ban anticoagulant rodenticides. We don't need to have that destructive a poison being used in our neighborhoods or near our food supplies. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Evan Elias

Pasadena, CA 91103

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Proposed regulations allowing expanded use of anticoagulant rodenticides in heavily trafficked areas is too dangerous. It certainly should not be allowed in restaurants and grocery stores! Allowing more days per year of its use anywhere is also alarming. I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. The current restrictions are not preventing deaths of our wildlife. With the planet in an ecological downward spiral, we should do everything possible to preserve what we currently have. Perhaps I do not need to remind you that there currently are other viable and cost-effective alternatives for diminishing both current and potential rodent infestations. When the situation requires it, there are many less toxic rodenticides available. Please ban the use of anticoagulant rodenticides in California.

Sincerely,

Carla Hanzlik
Seal Beach, CA 90740

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

California has been a leader in protecting wildlife, pets, and even children from harmful rodenticides. Yes, we need to reduce rat populations, but California has shown there are safer ways to accomplish this goal. Please do not revert back to less aware times. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California!

Sincerely,

Kevin Goodwin
Bakersfield, CA 93308

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

WE PAY YOU TO PROTECT, TO STOP PESTICIDES THAT TORTURE AND KILL INNOCENT ANIMALS ALL FOR MONEY! DO YOUR JOB AND IF YOU CAN'T PLEASE GET THE HELL OUT, NOW!

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Heather Brophy
Santa Barbara, CA 93109

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California. This move to ban these poisons is criminally late to be installed. When we poison the environment, we are poisoning ourselves. Thank you for your time and attention to this important matter.

Sincerely,

April Dice

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Subject: Protect Wildlife, Pets, and Communities — Ban Anticoagulant Rodenticides Dear California Department of Pesticide Regulation, As a California resident who cares deeply about protecting our wildlife and shared environment, I'm deeply concerned that the Department's draft regulations would expand the use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — places where they're currently prohibited for good reason. Allowing use of these poisons for over 100 days per year would dangerously undermine existing protections and expose both wildlife and people to unnecessary suffering and risk. Even with current restrictions, countless non-target animals — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes — are harmed or killed each year by secondary poisoning. These animals are vital to the health of California's ecosystems, and their loss has cascading ecological consequences. There are proven, humane, and cost-effective alternatives. Integrated pest-management strategies — such as sealing entry points and removing food and water sources — work. And when direct control is needed, non-toxic tools like contraceptives, snap traps, and electric traps can safely reduce infestations without poisoning the food web. For true emergencies, more than 100 less-toxic rodenticides remain available, and the Department can authorize very limited exemptions if absolutely necessary. There is simply no justification for weakening safeguards or expanding the use of chemicals known to cause internal bleeding, organ failure, and painful deaths. The science is clear: anticoagulant rodenticides are indiscriminate killers that threaten wildlife, pets, and people alike. I urge the Department to reject these proposed rollbacks and move decisively toward an outright ban on anticoagulant rodenticides in California. Thank you for your attention to this critical issue. Sincerely, Anthony (Tony) DeSena Rancho Mirage, CA tonyjd23@gmail.com

Sincerely,

Anthony DeSena
Rancho Mirage, CA 92270

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am writing to express my deep concern regarding the California Department of Pesticide Regulation's (DPR) recent draft regulations that would expand the use of anticoagulant rodenticides (ARs) in areas where they are currently prohibited — including restaurants, grocery stores, and other heavily trafficked public spaces. This proposal not only undermines existing protections but also poses a serious threat to California's wildlife, domestic animals, and public health. Even under current restrictions, anticoagulant rodenticides continue to cause widespread and unnecessary poisonings of non-target animals. These poisons do not act immediately, allowing rodents to wander and die slowly — often outdoors — where they become easy prey for predators and scavengers. This leads to secondary poisoning, a devastating ripple effect through the food chain. California's iconic wildlife has already suffered greatly. The tragic case of P-22, the beloved mountain lion of Griffith Park, brought national attention to the dangers of ARs. P-22 was found suffering from mange and internal damage linked to rodenticide exposure, ultimately contributing to his decline. Apex predators like mountain lions, bobcats, and owls play a vital role in maintaining ecological balance. When they are poisoned, entire ecosystems are destabilized. But the harm doesn't stop with wildlife. Domestic pets are frequently exposed to ARs, either by ingesting bait directly or by consuming poisoned rodents. Dogs and cats have been hospitalized or killed due to accidental exposure, and these incidents are often traumatic and costly for families. Children are also at risk, especially in urban areas where rodenticides may be used near homes, schools, and parks. Backyard wildlife — including raccoons, opossums, hawks, foxes, and even songbirds — are vulnerable too. These animals are part of California's natural heritage and contribute to healthy urban ecosystems. The use of ARs in residential and commercial areas threatens their survival and diminishes the biodiversity that makes our communities vibrant and resilient. The department's proposal to allow AR use for more than 100 days per year is especially alarming. This extended application period dramatically increases the risk of exposure to wildlife, pets, and people, and contradicts the intent of recent legislation aimed at reducing the use of these harmful substances. California has long been a leader in environmental stewardship and wildlife conservation. From protecting endangered species to pioneering climate action, our state has set the standard for responsible ecological policy. Expanding the use of anticoagulant rodenticides sends a dangerous and contradictory message — one that undermines decades of progress and public trust. Viable, cost-effective alternatives to anticoagulant rodenticides already exist. Integrated pest management (IPM) strategies — including building maintenance, sanitation, and exclusion techniques — are proven methods for preventing infestations. In cases where control is necessary, nontoxic solutions such as snap traps, electric traps, and rodent contraceptives offer effective and humane alternatives. Additionally, over 100 less toxic rodenticides remain available for use in extreme cases, ensuring that public health and safety are not compromised. Given the overwhelming evidence of harm and the availability of safer alternatives, I urge the department to take decisive action and ban the use of anticoagulant rodenticides statewide. In rare and exceptional circumstances, limited emergency exemptions could be considered — but widespread use must be prohibited to protect California's ecosystems, families, and future. Thank you for your attention to this critical issue. I respectfully request that DPR prioritize the health of our environment, wildlife, and communities by enacting a full ban on anticoagulant rodenticides.

Sincerely,

Gwen DeHaven

La Mesa, CA 91941

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections.

Sincerely,

Linda Cohen
Nevada City, CA 95959

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

The California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in areas where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year threatens wildlife and undermines important legal protections. For these reasons, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous poisonings of non-target animals occur each year, harming and killing beloved California wildlife like mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives already exist and would successfully address the threats posed by rodent infestations. More than 100 less toxic, non-anticoagulant rodenticides readily available to protect people and the environment from rodent infestations. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Please, outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Gail Mackey
Watsonville, CA 95076

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores, where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife, including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Control strategies such as; contraceptives, snap traps, electric traps and other types of nontoxic methods, could be used to address ongoing infestations. In serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause, and because safer, cost-effective alternatives already exist, I urge the department to outright ban the use of anticoagulant rodenticides in California. Thank you for your consideration.

Sincerely,

R Lynch
Marina, CA 93933

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Are we humane or just human? I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

S Moreno
Mill Valley, CA 94941

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I support strengthening protections and even the total eradication of these poisons in my state of California and beyond. We are working on awareness here, so reducing protections throws all that work and expense of informing the public to waste. I don't support a two steps forward one step back approach. We need to eradicate these poisons for the reasons stated below, but also, it's time to remove existing poisons sitting in residential sheds, garages, around restaurants, business parks and adjacent farm lands. So for me, this is progress, but much more needs to be done. Please BAN and REJECT anticoagulant rodenticides for ever. Please support future moves to eliminate existing poisons already in the hands of the public. Please restrict PESTICIDE COMPANIES from using these commercially, especially in the tamper-resistant boxes (bait stations) you see all around the city. Urban wildlife and our pets are just as important as the rest of our wildlife. ... I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to A A Complete Ban on the use of anticoagulant rodenticides in California is needed now!

Sincerely,

Robert Levitt
Fort Collins, CO 80525

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Human waste, not rodents, are the problem. We should clean up our own filth instead of poisoning animals because of our laziness. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and endangers other animals who happen upon a poisoned victim. I've watched gophers, squirrels and possums die excruciating deaths from ingesting anticoagulant. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kristin Mercer
Belmont, CA 94002

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I strongly oppose the California Department of Pesticide Regulation's draft regulations expanding anticoagulant rodenticide use in restaurants and grocery stores, where they're currently banned, and allowing use beyond 100 days per year. This expansion threatens wildlife and weakens legal protections. Even under current restrictions, these rodenticides unnecessarily poison California's wildlife including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Effective, cost-effective alternatives already exist. Integrated pest management - sealing buildings and eliminating food and water sources prevents infestations. Control methods like contraceptives, snap traps, electric traps, and other nontoxic approaches can address existing problems. Over 100 less-toxic, non-anticoagulant rodenticides remain available for serious cases, and the department could allow limited emergency exemptions when absolutely necessary. The science is clear: anticoagulant rodenticides harm wildlife and endanger people and pets. With safer alternatives available, I urge the department to ban anticoagulant rodenticides in California outright.

Sincerely,

Alexandra Johnson
Oakland, CA 94612

California Department of Pesticide Regulation

Dear Director Morrison,

I don't see barn owls flying in my neighborhood and I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Karen Watkins
Berkeley, CA 94710

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. We had a magnificent red tailed hawk drop dead at our feet due to poisoning from ingesting poisoned rat. It was heartbreaking to see this valuable animal senselessly die. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Gail Herson
Carpinteria, CA 93013

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. I would not be surprised if the iconic beloved Mountain Lion known as P22 did not have these in his system prior to his sad demise. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Valerie Carrick
Ontario, CA 91762

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I write with enormous concern about the California Department of Pesticide Regulation's recent draft regulations that would give the green light to an expanded use of DANGEROUS and UNETHICAL anticoagulant rodenticides in densely trafficked places like restaurants and grocery stores, where currently they are RIGHTLY prohibited. And, importantly, the department's proposal to green light use of these rodenticides for 100+ days a year does of course also threaten wildlife and will undermine very important legal protections. What are you all thinking?! For these reasons and MANY more, I strongly urge the department to change your ill-advised course and ban outright the use of anticoagulant rodenticides in the state of California, which is supposed to be a leader in informed thinking about the environment and natural world. Even with current restrictions on rodenticides, lots of unnecessary poisonings of non-target animals occur each year, harming and killing important California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. THIS ALREADY IS UNCONSCIONABLE! There are effective and cost-effective alternatives to anticoagulant rodenticides that already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Hilary Rand
San Francisco, CA 94146

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

As a wildlife biologist and rehabilitator, I'm outraged by the continued use of rodenticides. They are indiscriminate killers that are responsible for the death of many of our Foxes, Owls, bobcats, cougars and even our pets! Even if they don't kill the animal, it bioaccumulates in their tissues, and their immune system is compromised from fighting off any other health problem. Many coyotes and foxes come into our rescues with mange, and almost all of them are suffering the effects of rodenticide poisoning. There are many ways to fight a rodent infestation that don't kill non target species. If you've ever seen an animal or pet die from these poisons, you would ban them immediately. I am deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. Lets find another way to kill rodents. I use a snap trap and it is effective. Take away the food sources so that populations don't increase and let anyone using Rodenticides watch the process as the rodent dies as well as the next animal that eats the rodent. The intended cure kills more animals than the original goal For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. These dangerous, toxic chemicals have even harmed pets and children. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jocelyn Nelson
Fresno, CA 93710

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. As a wildlife professional, I have seen the trophic level affects of rodenticide use on raptors and other mammals. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Adelina Standish
Monterey, CA 93940

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am extremely concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Marilee Potthoff

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. This is absolutely **WRONG**. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes...as well as our pet cats and dogs. The animals die a violent and most inhumane death so please do not allow these substances anywhere on our planet. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ionna richmond
Sausalito, CA 94965

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I worry that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Robert Kvaas
Goleta, CA 93117

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

There are too many poisonous substances in our many environments. Please ban the use of anticoagulant rodenticides in California. Safe alternatives exist like sealing buildings and eliminating the food and water sources that draw rodents, using contraceptives, snap traps, electric traps, and other types of nontoxic methods. If necessary to combat infestations, there are more than 100 less toxic, non-anticoagulant rodenticides available to protect people and the environment. Anticoagulant rodenticides hurt wildlife and put people and pets at risk. That much I clear, so it's time to put a stop to their use.

Sincerely,

Jennifer Russell
Walnut Creek, CA 94595

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm appalled that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores, where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I strongly request that the department rethink their actions and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife, including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies, like contraceptives, snap traps, electric traps, and other types of nontoxic methods, could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming. Anticoagulant rodenticides harm wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause and because safer, cost-effective alternatives already exist, I urge the department to institute a ban on the use of anticoagulant rodenticides in California.

Sincerely,

Sharon Morris

Jeri Edwards
Arroyo Grande, CA 93420

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Dear Director Morrison: I urge the Department of Pesticide Regulation to ban anti-coagulant rat poisons. Anti-coagulants can poison cats, dogs, bobcats, owls, hawks, and eagles. Of course, it is a shame to kill people's pets as well as the very animals who keep rat populations down. Instead, California cities should be encouraged to both use snap traps and adopt the Working Cat Programs that some cities, including Los Angeles, have adopted. These programs get people to care for feral cats and get them spayed/neutered. But at the same time, the feral cats help with the rats. I have years of experience eliminating rats around my home. We have a cat, and she helps. In addition, I use snap traps to kill rats. This is often what the pro's use, too. Snap traps are extremely effective when properly set. I've caught dozens of rats this way. And they can be baited with tiny pieces of chocolate, which most other animals dislike. They can be placed where other animals won't reach them. Complete elimination of rats is probably not possible. There are always more where the dead ones came from. Rats have been with us humans probably...forever. So, we shouldn't be killing off the very animals that eat rats. I urge you to ban anti-coagulant rat poisons.

Sincerely,

Alexandra Hopkins
La Crescenta, CA 91214

Director Karen Morrison
California Department of Pesticide Regulation

Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Linda Webb
Mount Shasta, CA 96067

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned about the use of anticoagulant rodenticides in my neighborhood, community, and, honestly, the world. I have attempted to rehabilitate raptors who have been poisoned. I have watched pets die. All because they were doing exactly what they should be doing and irresponsible homeowners had poisoned their prey. The California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and **BAN THE USE OF THESE POISONS** in California. Every California mountain lion that has been lost and autopsied in the past decade has shown the impact of rat poison. Every California Condor is threatened by the same. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like snap traps, electric traps, and the appropriate predators — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Sandy Richter

Citrus Heights, CA 95610

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Please ban rodenticides!!! I live in an area that has coyotes, bobcats, roadrunners, skunks, etc. I've lived in my house over 30 years and I've witnessed the decline of wildlife from poisons. There are alternatives - please require that they be used instead of poisons!!!

Sincerely,

Nancy Hill
Summerland, CA 93067

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Dear California Department of Pesticide Regulation, As a lifelong Californian and volunteer in local wildlife rehabilitation, I've seen firsthand the heartbreaking consequences of rodent poisons on non-target animals. Every year, mountain lions, bobcats, owls, and even coyotes suffer and die after consuming poisoned prey. These are vital members of our ecosystems — they help naturally control rodent populations, yet they're the ones paying the price for our reliance on toxic chemicals. I'm deeply concerned that the department's proposed regulations could expand the use of anticoagulant rodenticides in areas like restaurants and grocery stores, and allow their use for more than 100 days per year. That decision would undo years of progress toward protecting both wildlife and public health. In my own community here in southern California, local mountain lions — including those in the Santa Ana Mountains — already face extreme pressures from habitat fragmentation and vehicle collisions. Adding poison exposure only worsens their chances of survival. There are proven, cost-effective alternatives to these poisons, including integrated pest management, improved sanitation, and non-toxic control methods like electric or snap traps. I urge the department to fully ban the use of anticoagulant rodenticides and to instead promote safer, science-based solutions that protect both people and wildlife. Thank you for your attention and for your commitment to a healthier, more sustainable California.

Sincerely,

Kalli Linde
Aliso Viejo, CA 92656

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Living in a big city there are rodents and owls are the best and safest way for this to be dealt with. If you poison the rodents you poison everything from our water systems to our children to our household pets, all birds and squirrels and any other small creatures! Use peppermint oil iT works to keep critters away from your home and food! There is no need for poisons that eventually will kill us all! I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

It is astonishing that despite recently losing a costly lawsuit in Alameda County Superior Court (RATS et al v. DPR) regarding your assessment of FGAR's, DPR irrationally proposes regulations that would allow restaurants and grocery stores to extend their lawful use of these rodenticides. You are well aware of the extensive scientific research concerning the unintended, often deadly d poisoning of barn owls, Great horned owls, cougars, coyotes, bobcats, raccoons, opossums and foxes that too often occur when those animals kill or scavenge and then eat the prey poisoned by anticoagulant rodenticides. Preventing vermin infestations is best done via an IPM approach, integrated pest-management strategies like daily cleanup of food and garbage and sealing buildings to prevent intrusions. As a homeowner, I use very effective rodent snap traps There is no shortage of lethal control strategies for vermin that do not jeopardize native wildlife. Please ban the use of anticoagulant rodenticides by individuals, businesses and government entities across the state in all non-emergency situations.

Sincerely,

Don Lipmanson
Sebastopol, CA 95472

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Are you actually going to allow the expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores? If so — then this is absolutely wrong because this still threatens wildlife and undermines important legal protections AND the science is overwhelming: Anticoagulant rodenticides do hurt wildlife and do put people and pets at risk of accidental poisoning!! There are safer, cost-effective alternatives!! You ABSOLUTELY must ban the use of anticoagulant rodenticides in California!!! You want your dog poisoned? It happens!!!!

Sincerely,

Louise Gray
Sacramento, CA 95833

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am writing because I'm concerned to hear that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and consider a ban on the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. These poisons are often consumed by wild pigs, which are often hunted and eaten by human beings, thus posing a potential threat to public health. I am told that viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, I understand that more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I respectfully urge the department to consider a ban on the use of anticoagulant rodenticides in California. Thank you for your time and consideration.

Sincerely,

Rachael Denny
Bradley, CA 93426

Director Karen Morrison
California Department of Pesticide Regulation

Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California. Please don't ignore the Science.

Sincerely,

Burt Torgan
Berkeley, CA 94707

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and domestic pets and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ann Carranza
Healdsburg, CA 95448

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. It also threatens pet dogs who hike with their owners--or even ingest rodents who have just eaten some rodenticide in a field somewhere and then go into an urban area. Dogs can then eat the rat in their OWN BACKYARD! For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am a birdwatcher and hiker living in Hayward California. I'm worried that loosening regulations on anticoagulant rodenticides will kill our native eagles, hawks and owls. Just last year anticoagulant rodenticides killed Flaco, the beloved owl who lived in Central Park. After the painful deaths of birds like Flaco, I believe states should be tightening restrictions on these rodenticides, not loosening them. The California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of hawks, owls, bobcats etc occur each year, harming and killing beloved California wildlife. They even harm threatened species like spotted owls and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Catherine Cameron
San Jose, CA 95125

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Anyone who has ever lost a pet to unintentional pest poisoning knows first hand the pain of loss. And let's not kill wild life accidentally either. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Gretchen Del Rio
San Jose, CA 95124

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I am a 76 year old veteran with Parkinson's and I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I believe that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year threatens wildlife and undermines important legal protections. I ask that the department ban anticoagulant rodenticides in California. I believe this is the best course, and I am among the hundreds of thousands of Californians who have faced rodent problems, and been able to get past those problems with strategies like building sealing, managing food waste, and eliminating rodent hiding places. I know that even with current restrictions on rodenticides, unnecessary poisonings of non-target animals occur every day, harming and killing wildlife — including mountain lions, bobcats, owls and other raptors. A few years ago I watched a popular local webcam focused on a family of local barn owls as every member of that family succumbed to rodenticide poisoning. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow **very limited** emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to ban the use of anticoagulant rodenticides in California.

Sincerely,

Patrick Carr
Arcata, CA 95521

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. I live in a rural area with many raptors, and animals which I treasure. I do not want to see them suffer painful deaths from rodenticides. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

As a veterinarian practicing in California, I have seen the cruel and devastating effects that anticoagulant rodenticide poisonings have on animals. These rodenticides do not only affect their target species. They also kill our pets who very often mistakenly eat them and there is evidence that the whole chain of wildlife from prey to predator is being slowly poisoned. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the California Department of Pesticide Regulation to change course and ban outright the use of anticoagulant rodenticides in California. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings, eliminating the food sources that draw rodents in, and control measures such as contraceptives is a crucial first step. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California. California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. I'm concerned about our owls and hawks, as well as pet cats and other wildlife. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ruth Zachary
Atascadero, CA 93422

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm very deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to please change course and ban outright the use of anticoagulant rodenticides in California!! Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations!!!! Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I strongly urge the department to outright ban the use of anticoagulant rodenticides in California!!! Thank you for your consideration!!!!

Sincerely,

D Woolley
Torrance, CA 90505

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm very concerned that the California Department of Pesticide Regulation's recent draft regulations will expand the use of anticoagulant rodenticides in new areas like restaurants and grocery stores — where they are currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year continues to threaten wildlife and undermine important legal protections. I understand the value of wildlife to humans! I urge the department to BAN the use of anticoagulant rodenticides in California. We find that under current restrictions on rodenticides, poisoning of non-target animals occurs each year, killing many of our California wildlife. Viable, cost-effective alternatives to anticoagulant rodenticides already exist! These would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a critical first step. Then control strategies (such as: contraceptives, snap traps, electric traps, other types of nontoxic methods) could be used to address ongoing infestations. In a worst-case-scenario, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. In a serious public health or environmental emergency, when rodent infestations can't be addressed in any other way, the department could allow a *very limited emergency exemption' for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. There is overwhelming harm caused by anticoagulant rodenticides!— Safer, cost-effective alternatives already exist! I urge the department to ban the use of anticoagulant rodenticides in California.

Sincerely,

Diane Hichwa
The Sea Ranch, CA 95497

Sincerely,

Nancy Schweiger
Boulder Creek, CA 95006

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I live in a rural area and I have seen the effects of these poisons on our wildlife, including fox and burrowing owls. People want to kill rodents when their populations surge after wet years but they don't understand the broad effect on the food chain. When you see a full aisle of poisons available at Home Depot, they think it's safe. We must learn to use alternatives to killing. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. Sincerely,

Linda Harter
Joshua Tree, CA 92252

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

Remember Flaco? The beautiful Eurasian eagle-owl who escaped from the Central Park Zoo and lived wild for several months? The species can live up to 20 years in the wild, but Flaco suffered a slow, painful death after only a few months of freedom because he ate rats poisoned with rodenticides. I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. **JUST LIKE FLACO.** Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. Dear Director Morrison,

Please don't allow more rodenticides in my neighborhood. I live near restaurants and grocery stores and walk my dog past them. Hawks, eagles, falcons and owls that live in the trees in my neighborhood are some of my favorite neighbors. A young golden retriever I knew died from eating these rodenticides, RIP Nala. We don't need this anymore, we have spent plenty and will spend more on restoring our wildlife - why let that money and that effort be undone when there are cost-effective safer alternatives out there? I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Heidi Petersen

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Sabrina Thompson
El Dorado Hills, CA 95762

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Sandra Warry
Sebastopol, CA 95472

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Douglas Hammer
Oakland, CA 94610

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Maria Nowicki

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Yvonne Kouza
Bonita, CA 91902

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jane Orbuch
Santa Cruz, CA 95065

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Martin Marcus
San Diego, CA 92120

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Arnold Schildhaus

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

James Kerr
Redwood Valley, CA 95470

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Zora Hocking
Santa Rosa, CA 95401

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kenneth Magana
Hesperia, CA 92345

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

David Wappler
Ventura, CA 93003

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Sylvia Ren

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Audrey Okubo
San Jose, CA 95129

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

ann allen

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Caryn Graves

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Christine Stewart
Escondido, CA 92026

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Holly Hall
Temecula, CA 92592

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

June Cancell
Menlo Park, CA 94025

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kathleen Fernandez

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Rea Freedom
Los Gatos, CA 95033

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Marlena Lovewell
Lancaster, CA 93535

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Nancy Walter
San Luis Obispo, CA 93405

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Phallon Davis

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kiran Annavarapu
Irvine, CA 92623

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jennifer Parker
Los Angeles, CA 90068

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Laurie Kinnings
Garden Grove, CA 92841

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Kathryn Santos

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Scott Rubel
Los Angeles, CA 90031

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Patricia Marlatt
Los Angeles, CA 90068

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ali Moshrefi
Hayward, CA 94544

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Ilya Turov

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Allan Chen
Alameda, CA 94502

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Cynthia Whitman
Sonoma, CA 95476

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jeannette Ralston
Half Moon Bay, CA 94019

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Rachelle McLaughlin

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Jan Kuroyama
Redondo Beach, CA 90277

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

pucznik katz
Los Angeles, CA 90034

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Lisa Owens
Sebastopol, CA 95472

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Richard Taylor

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Lisa Ann Kelly and Family
Santa Barbara, CA 93101

Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations. For worst-case scenarios, more than 100 less toxic, non-anticoagulant rodenticides would still be available to protect people and the environment from rodent infestations. And in serious public health or environmental emergencies, when rodent infestations can't be addressed in any other way, the department could allow *very limited* emergency exemptions for anticoagulant rodenticide use. The science is overwhelming: Anticoagulant rodenticides hurt wildlife and put people and pets at risk of accidental poisoning. Because of the overwhelming harm anticoagulant rodenticides cause — and because safer, cost-effective alternatives already exist — I urge the department to outright ban the use of anticoagulant rodenticides in California.

Sincerely,

Deborah Santone
Pleasant Hill, CA 94523

Director Karen Morrison
California Department of Pesticide Regulation

Dear Director Morrison,

I'm deeply concerned that the California Department of Pesticide Regulation's recent draft regulations will allow for expanded use of anticoagulant rodenticides in heavily trafficked areas like restaurants and grocery stores — where they're currently prohibited. The department's proposal to allow use of these rodenticides for more than 100 days per year also threatens wildlife and undermines important legal protections. For these reasons and more, I urge the department to change course and ban outright the use of anticoagulant rodenticides in California. Even with current restrictions on rodenticides, numerous unnecessary poisonings of non-target animals occur each year, harming and killing beloved California wildlife — including mountain lions, bobcats, spotted owls, and San Joaquin kit foxes. Viable, cost-effective alternatives to anticoagulant rodenticides already exist and would successfully address the threats posed by rodent infestations. Working to prevent infestations by implementing integrated pest-management strategies, like sealing buildings and eliminating the food and water sources that draw rodents in, is a crucial first step. Then control strategies — like contraceptives, snap traps, electric traps, and other types of nontoxic methods — could be used to address ongoing infestations.
