

Karen Bolte

Your dog or cat may be the unintended swallower of this rodenticide by swallowing creatures who ingested it. All the wildlife your children see and watch may suffer agonizing death at your hand. Putting this out into the environment to kill rodents is like taking poison into your body to kill a bacteria on your toe; it will do it's killing throughout your body and reduce immunity to deal with more. In this day of advanced science, and after the many effects of Agent Orange (Roundup), can't we be more targeted than this? Do you want to line the pockets of those negligently promoting it?
