My family relies on water from the shared building supply, and lately we have had reasons to question whether it is truly safe.

Even after boiling, the water keeps a chemical smell that does not go away.

Guests have commented on the taste of the water, and I am honestly a little embarrassed to serve it.

After a main break the water looked like weak tea for almost two days before it cleared.

I once filled a clear glass and found tiny particles floating in it, which really worried me.

Nitrate levels from nearby farm runoff are a worry, especially for households with infants.

A schedule for replacing lead service lines should be published, with clear dates and street-by-street progress.

Many of the water mains in the riverside district are more than seventy years old and break far too often.

Sampling locations should include older neighborhoods and not just the sites that are easiest to reach.

Small businesses such as cafes and bakeries in our apartment complex are also affected, because water taste matters for their products.

Environmental groups in the region have valuable data, and I think the utility should partner with them more openly.

Gardeners nearby have noticed that tap water leaves white residue on leaves and seems to stunt some plants.

My hope is that this comment, together with many others, will push the project toward real improvements.
