As a resident of our apartment complex for three years, I feel the water quality issue deserves far more attention than it gets.

The smell of chlorine is strongest when the weather turns hot, and it lingers on my hands after washing dishes.

Arsenic and other naturally occurring minerals concern me because I depend on the water from the kitchen faucet.

Algae blooms in the reservoir have been reported, and I want to be sure toxins are properly screened for.

My child developed skin irritation that cleared up only after we started using filtered water for baths.

People with weakened immune systems in our community need specific advisories whenever a problem is detected.

Many of the water mains in our apartment complex are more than seventy years old and break far too often.

Test results should be posted online in an easy-to-read format, not buried in a long annual report.

Sampling locations should include older neighborhoods and not just the sites that are easiest to reach.

Residents deserve to see trends over many years, not only a single snapshot of the current results.

Fishing and recreation on the nearby river depend on healthy source water, so protecting the watershed benefits everyone.

I remain hopeful that, with proper funding and oversight, we can restore confidence in our water supply.
