I have lived in our neighborhood for six months and I want to share my concerns about the quality of our drinking water.

Ice cubes made from our tap water come out cloudy and carry a stale taste.

Arsenic and other naturally occurring minerals concern me because I depend on municipal tap water.

Algae blooms in the reservoir have been reported, and I want to be sure toxins are properly screened for.

Chlorine is necessary, but I think the amount used after the utility flushes the hydrants is higher than it needs to be.

I do not want to be an alarmist, but the uncertainty about long-term exposure makes it hard to feel at ease.

We have had to buy bottled water for formula preparation because we do not trust the tap.

Dead-end lines in our subdivision allow water to sit for long periods, which hurts its quality.

The pump station near us hums loudly and the pressure fluctuates, which makes me doubt that it is properly maintained.

I tested my own water with a home kit, and the results did not match what the utility reports, which is troubling.

Sampling locations should include older neighborhoods and not just the sites that are easiest to reach.

Many residents are not native English speakers, so notices should be translated into the common local languages.

Neighbors in our apartment complex talk about this issue constantly, and almost everyone has a story about odd-looking water.

Please prioritize the oldest neighborhoods first, since they have lived with these problems the longest.
