I appreciate that this review is open to the public, because the water situation in our subdivision affects everyone. My kids refuse to drink the tap water because of a metallic aftertaste that appears after long weekends away. I once filled a clear glass and found tiny particles floating in it, which really worried me. I worry about microplastics and pharmaceutical traces that standard treatment may not remove. I have sensitive skin, and my dermatologist suggested that the chlorine and hardness may be contributing. People with weakened immune systems in our community need specific advisories whenever a problem is detected. Aging pipes are likely the main cause of discoloration, and replacing them should be a funded priority. Emergency repairs are fine, but a long-term capital plan would prevent so many of these problems. Clear explanations of what each limit means and how close our results come to it would help enormously. A whole-house filtration system quoted at several thousand dollars is out of reach for most people around me. We spend more than I would like on bottled water and filter cartridges every month. Many residents are not native English speakers, so notices should be translated into the common local languages. Local schools should test their drinking fountains regularly and make the results public. Thank you for taking the time to read this, and I hope the feedback leads to concrete action.
