I run a small household budget and have noticed that water quality problems in my building are costing us real money. I can taste the difference between morning and evening water, and the evening water is usually harsher. Sediment collects at the bottom of our water pitcher within a day, and the filter turns dark in weeks. Algae blooms in the reservoir have been reported, and I want to be sure toxins are properly screened for. People with weakened immune systems in our community need specific advisories whenever a problem is detected. Public health should be the first consideration when decisions are made about treatment and funding. We have had to buy bottled water for formula preparation because we do not trust the tap. Clear explanations of what each limit means and how close our results come to it would help enormously. When a violation occurs, notifications must reach residents immediately by text, phone, and mail, not days later. We spend more than I would like on bottled water and filter cartridges every month. Affordable access to safe water ought to be treated as a basic public service, not a luxury. Rebates for filters and plumbing replacement would make a real difference for low-income households. I look forward to seeing a clear timeline and measurable targets for better water quality.
