I am commenting as a longtime customer of the local water system in my building.

There is sometimes a faint rotten-egg odor when I run the hot water, which suggests something is wrong in the system.

Sediment collects at the bottom of our water pitcher within a day, and the filter turns dark in weeks.

Pregnant women and infants are the most vulnerable, so safety margins should be strict and well communicated.

Our family doctor asked whether we drink from the tap, which made me realize this is a real health question.

People with weakened immune systems in our community need specific advisories whenever a problem is detected.

Storage tanks should be inspected and cleaned on a regular schedule, with the results shared with the public.

Many of the water mains in the riverside district are more than seventy years old and break far too often.

Treatment plant upgrades have been delayed repeatedly, and residents are left to cope with the consequences.

We spend more than I would like on bottled water and filter cartridges every month.

I installed a reverse osmosis system under the sink, but I resent paying for a fix that the utility should have handled.

A whole-house filtration system quoted at several thousand dollars is out of reach for most people around me.

I am willing to participate in any pilot program, survey, or focus group related to water quality.
