

Brian Jones

I am concerned about the potential impacts this project could have on local water regarding runoff, sedimentation, and possible contamination of nearby streams and groundwater.

This project could have meaningful economic effects on nearby communities, and those impacts should be carefully evaluated. While development may bring some economic benefits such as temporary construction jobs or increased local spending, it could also place pressure on housing, infrastructure, and public services.

Air impacts should be analyzed in detail, particularly during the construction phase when equipment, truck traffic, and dust generation could increase emissions in the surrounding area. Long-term operational emissions should also be evaluated to ensure that the project does not contribute to exceedances of local or regional air quality standards.
