

Renee Barnette

Dear USDA, Please follow through on your duty to assess individual “inert” ingredients used in organic production. In creating the original regulations for the National Organic Program (NOP), the USDA, based on the recommendation of the National Organic Standards Board (NOSB), decided to postpone the evaluation of so-called “inert” ingredients until active materials had been reviewed for the National List of Allowed and Prohibited Substances. The first regulation and all subsequent revisions have allowed the use of “inert” ingredients on EPA Lists 4A (“minimal risk inert ingredients”) and 4B (“other ingredients for which EPA has sufficient information to reasonably conclude that the current use pattern in pesticide products will not adversely affect public health or the environment”). A limited number on List 3 (“inerts of unknown toxicity”) were allowed in pheromone products. The Organic Foods Production Act (OFPA) requires that no synthetic substance may be used in organic production unless evaluated and recommended by the NOSB and entered on the National List, which is contained in NOP regulations. Now, USDA is accepting comments on an advance notice of proposed rulemaking (ANPR) on “inert” ingredients used in organic production. The ANPR reflects a lack of understanding on the part of the USDA authors of the character of so-called “inert” ingredients and the requirements of the Organic Foods Production Act, as well as the history of efforts by the NOSB to address this issue. USDA refers to time, effort, and work required to implement the NOSB’s recommended reviews of individual “inert” ingredients. These references are disingenuous at best, considering the time that has elapsed since the issue became critical when the Environmental Protection Agency (EPA) announced that it was no longer supporting the lists to which NOP regulations refer, which was 16 years ago! The following crucial facts must be acknowledged: - “Inert” ingredients are not biologically or chemically inert. The Beyond Pesticides report “‘Inert’ Ingredients in Organic Production” compares the toxicity of active substances and “inert” substances used in organic production. In almost every category, there are more harmful “inerts” than active substances. - OFPA allows the use of a synthetic substance in organic production only if it is listed on the National List “by specific use or application” based on a recommendation by the NOSB, following procedures in OFPA. - The NOSB has repeatedly passed recommendations telling NOP to evaluate individual “inerts.” In the future, there must be no more delay. The following is recommended: - There should be immediate publication in the Federal Register of all “inerts” known to be used in organic production, with a request that registrants of products approved for use in organic production to notify AMS if their products contain other “inert” ingredients. - USDA should allocate resources needed to review substances that are identified. - Former List 3 “inerts” must be relisted according to the Spring 2012 NOSB recommendation. - USDA should establish a process for production of technical reviews of substance on former Lists 4A and 4B. - The NOSB should evaluate the substances according to a process designed to complete the review of all “inerts” within five years of publication of the list, and USDA must complete rulemaking in accordance with OFPA and NOSB recommendations. - All known endocrine disrupting and persistent organic pollutants, such as nonylphenol ethoxylates (NPEs), per- and polyfluoroalkyl substances (PFAS), bisphenols, and orthophthalates, should absolutely not be permitted. - Every five years (or less) the materials should be subject to sunset review. Thank you for your consideration of my comments and recommendations on this issue which impacts life, and our current and future health as a species. Take care,
